Angular Lab 1 (Using Components)

In this lab you will add a footer component to the Angular App. Feel free to do the steps here or go your own way with the footer component

1. Generate a new component called 'foot'
   ng g c foot
2. Inside app.cpmponent.html write an instance of this component
3. Inside foot.component.ts add the following property to the FootComponent class:
   today=new Date()
4. Inside foot.component.html, delete all content then write this:
   <footer>The date is {{today |date}}</footer>

   ## The date is Aug 22, 2023

5. You can read more about the 'date pipe' here:
   https://angular.io/api/common/DatePipe#usage-notes
6. Optionally add css and other content to this foot component
7. Optionally implement a 'head' component to appear at the top of the application
   Fill it with any content you like
